

## Lesson 3.5 - Right Triangle Trig Applications

Learning Objectives: SWBAT

### 1. Solve Real World Problems involving Right Triangle Trigonometry

Example:

Elise is standing on top of a 50 foot building and sees her friend, Molly. If Molly is 30 feet away from the base of the building, what is the angle of depression from Elise to Molly? Elise's eye height is 4.5 feet.

Because of parallel lines, the angle of depression is equal to the angle at Molly, or  $x^\circ$ . We can use the inverse tangent ratio.

$$\tan^{-1}\left(\frac{54.5}{30}\right) = 61.2^\circ = x$$

Practice: **TIP** - When solving the problems below, draw a picture of the triangle, circle the angle of reference and label the sides O, A and H.

1. A damsel is in distress and is being held captive in a tower. Her knight in shining armor is on the ground below with a ladder. When the knight stands 15 feet from the base of the tower and looks up at his precious damsel, the angle of elevation to her window is 60 degrees. How long does the ladder have to be?
  
2. You are 200 yards from a river. Rather than walking directly to the river, you walk 400 yards along a straight path to the river's edge. Find the acute angle between path and the river's edge.

## Lesson 3.5 - Right Triangle Trig Applications

### Practice

3. A 12 meter flagpole casts a 9 meter shadow. Find the angle of elevation of the sun.
4. Suppose you're flying a kite, and it gets caught at the top of the tree. You've let out all 100 feet of string for the kite, and the angle that the string makes with the ground is 75 degrees. Instead of worrying about how to get your kite back, you wonder. "How tall is that tree?"
5. Suppose that Mike and Dave are making measurements for the road-paving crew. They need to know how much the land slopes downward along a particular stretch of road. Dave walks 80 feet from Mike and holds up a long pole, perpendicular to the ground, that has markings every inch along it. Mike looks at the pole through a sighting instrument. Looking straight across, parallel to the horizon, Mike sights a point on the pole 50 inches above the ground- call it point A. Then Mike looks through the instrument at the bottom of the pole, creating an angle of depression. Which is the angle of depression or slope of the road, to where Mike is standing?
6. A submersible traveling at a depth of 250 feet dives at an angle of  $15^\circ$  with respect to a line parallel to the water's surface. It travels a horizontal distance of 1500 feet during the dive. What is the depth of the submersible after the dive?

## Lesson 3.5 - Right Triangle Trig Applications

### Practice

7. A fire department's longest ladder is 110 feet long, and the safety regulation states that they can use it for rescues up to 100 feet off the ground. What is the maximum safe angle of elevation for the rescue ladder?
8. Brothers Bob and Tom Katz buy a tent that has a center pole 6.25 feet high. If the sides of the tent are supposed to make a  $50^\circ$  angle with the ground, how wide is the tent?
9. A swimming pool is 30 meters long and 12 meters wide. The bottom of the pool is slanted so that the water depth is 1.3 meters at the shallow end and 4 meters at the deep end. Find the angle of depression of the bottom of the pool.
10. In rhombus ABCD, diagonals  $\overline{AC}$  and  $\overline{BD}$  meet at point E. If the measure of angle DAB is  $46^\circ$ , find the length of  $\overline{EB}$ .

## Lesson 3.5 - Right Triangle Trig Applications

### Practice

11. The tallest television transmitting tower in the world is in North Dakota, and it is 2059 feet tall. If you are on level ground exactly 5280 feet (one mile) from the base of the tower, what is your angle of elevation looking up at the top of the tower?
  
12. Ophelia Payne is walking to her office building which she knows is 150ft high. The angle to the top of the building from her current location is  $6^\circ$ . How much further does she need to walk?
  
13. An observer on the ground at point A watches a rocket ascend. The observer is 1200 feet from the launch point B. As the rocket rises, the distance  $d$  from the observer to the rocket increases.
  - a. Express the measure of angle A in terms of  $d$ .
  - b. Find the measure of angle A if  $d = 1500$  feet.
  - c. Find the measure of angle A if  $d = 2000$  feet.
  
14. At a point 200 feet from the base of a building, the angle of elevation to the bottom of a smokestack is  $35^\circ$ , and the angle of elevation to the top is  $53^\circ$ . Find the height  $s$  of the smokestack.
